

THE CONTRASTIVE PHONEMS
IN BASQUE:
VALUES AND TRANSCRIPTION

TXILLARDEGI
San Sebastian

1. The contrastive phonemes in Basque: values and transcription.

1.1 - A first problem is to choose the Basque dialect taken as "standard Basque". But there is not, for the moment, (at the phonological level), such a "standard".

We are obliged to suggest the following table for the Basque "koine":

p b		t d					c ʃ	k ɡ	
m				n			ɲ	(n)	
(β)	f	(ð)		ɟ				x (ɣ)	h
			s		ʂ	ʃ			
			ts		tʂ	tʃ			
				l			ʎ		
				ʀ					
				r					

1.2 - Some I.P.A. symbols are difficult to write; so in this work we will use instead:

[š] for [ʂ]

[č] for [tʂ]

[š] for [ʃ]

[č] for [tʃ]

[b, p, f] for continuants [β, ɸ, γ]

[t, d] for [c, ʃ]

[ɲ] for [ɲ]

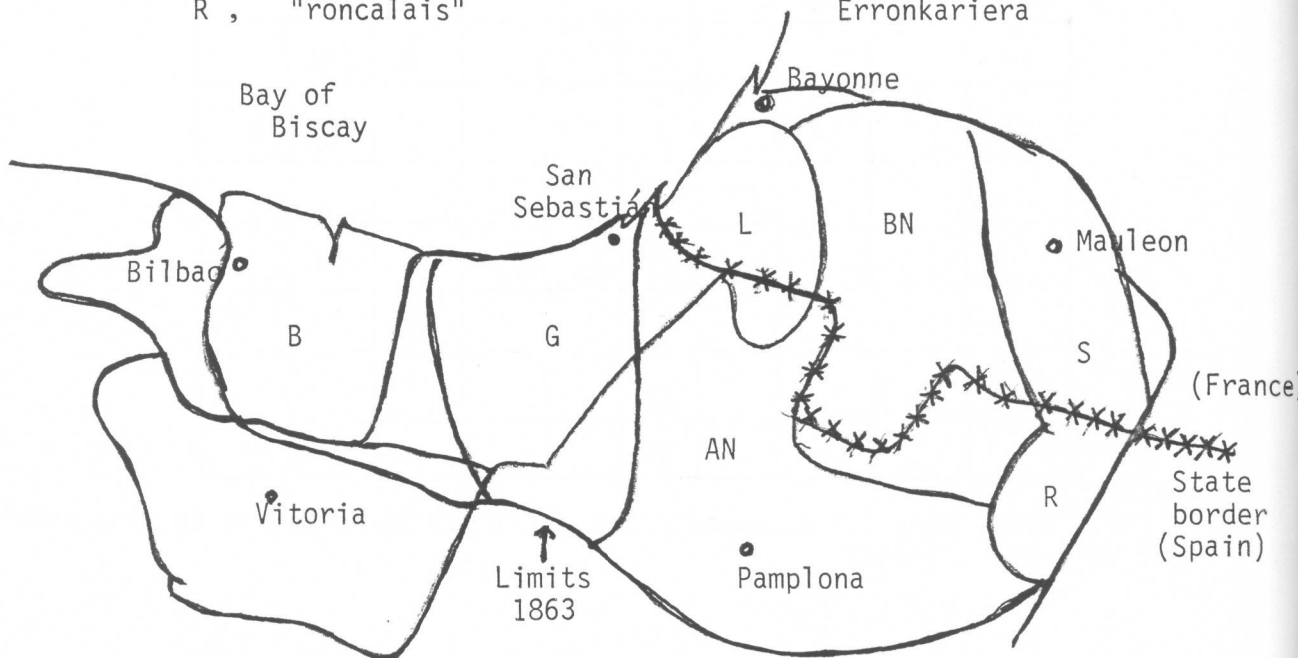

[ʎ] for [ʎ]

[r̄] for [r]

[r] for [s]

1.3 The geographical distribution of the Bsq. dialects is the following:

<u>Common designation (French)</u> (Bonaparte, 1863)	<u>Bsq. name</u>
B , "biscayen"	Bizkaiera
G , "guipuscoan"	Gipuzkera
AN, "haut-navarrais"	Nafarrera
L , "Labourdin"	Lapurtera
BN, "bas-navarrais"	Baxenabarrera
S , "souletin"	Zuberera
R , "roncalais"	Erronkariera

When we make allusion to them, we will only give their capital letter.

1.4 The sounds [ɸ, ɬ, ɣ] (= IPA, [β, δ, γ]) only appear after vowel (syllabic or not), and after [r̄].

The sound [ɣ] only before a velar .

So they are between parenthesis (in the table).

1.5 We will use the SPE-features.

But some remarks seem necessary.

1.51 We think it is better to consider:

h = [ɸ obs].

against the initial value in SPE.

1.52 For the retroflexes (or post-alveolars), we take:

{ś , ć} = [- ant]

even if their point of articulation varies from a dialect to another.

2. Possible onsets

2.1 In medial position.

2.11 \$C

All the segments being [+ cons] can be onsets in that position.
For example:

[sesen]	[se\$sen]	'bull'
[sara]	[sa\$ra]	'are' (you)
[hařo]	[ha\$řo]	'hollow'
[oćo]	[o\$ćo]	'wolf'
[aco]	[a\$co]	'yesterday'
[neška]	[ne\$ška]	'girl'
[biće]	[bi\$će]	'way'

We wrote [+ cons], not [+ syll]. Since in the most common dialects (B, G, AN and L), it is usually accepted that there are not rising diphthongs. This is only true as a first approximation to the facts. Even in recent loans, that tendency is clear:

Sp. [no ^h bjo]	'boy-friend',	Bsq. [no ^h bišo]
[śwérte]	'luck',	[śubérte]

But in BN, S and R rising diphthongs are normal. It seems to be an innovation: but it is not always sure. We will come back to it.

Let us recall that rising diphthongs are normal in French and in Spanish.

2.12 -#C

2.121 In Bsq. no word begins with [r], nor [ř]. Even now, the epenthesis of a vowel is obligatory:

Sp. [řáđo]	'lightning',	Bsq. [ařađo]
[řepúblika]	'republic',	[eřepúblika]

2.122 In isolation no word begins by [b̥, d̥, g̥]:

[bide], not [b̥ide]

But in composition, this same word can change its status:

[bide], but "Hirubide" [hirub̥ide]

2.123 No word can begin with affricates. It is possible to give not more than one example:

[cař], 'evil'

2.124 It is difficult, but not impossible, to find any word beginning by a palatal sound when it is [- obs]:

[jabuř], 'a bit short'

(but [labuř] exists: and it is normally the case with these pairs).

2.13 \$CC

We can make the same remark: since normally we don't have any rising diphthongs, we can write:

*\$Cj and *\$Cw

for B, G, AN and L. But not for the others:

(R) [enún egwárt] 'I don't remember'

(BN) [donjane] 'Saint Jean Pied de Port'

2.131 There is one rising diphthong, common in Bsq.: [wi]. And if it was difficult to give examples for \$wi onsets:

[wici] ('Huici', a village in Navarre)

it is not so for \$Cwi onsets. For example:

[otad̥wi] (family name)

[aɖašt̥wi] (fam. n.)

[a|wic] (mountain name in Biscay)

[ařwic] (village name in Navarre)

[-dwi] (very common toponymie-suffix)

2.132 Let us give some lists of \$CC onsets.

\$CrV (normally pronounced CřV):

pr [impřimatu]

tr [eštřata]

kr [eškřamentu]

[apřopoš]

[aštřabuđua]

[deškřasia]

[alpřoxa]

[atřalaka]

[krompřitu]

[ištřipu]

[alpřaketa]

[kontřa]

[kompřome]

[butřoe]

br [liřratu]

dr [andře]

gr [gřasia]

[lambřo]

[andřaka]

[sangřikol] (BN)

fr [afřuntu]

It is easy to see that:

a) most of these examples are loans (Sp. "imprimir", Fr. "à propos." and so on).

b) In many cases, we can find the same word with the cluster split into two syllables: [andře]=[andere], 'woman'; [gřasia], but [garasi] ('grace')

c) in some cases (gr, kr, fr) it is almost impossible to find any normal and usual word. But in others, the clusters are the consequence of an unnecessary metathesis:

Bsq. [alpřaketa]	Sp. [alpařgata]	'sort of sandal'
[kompřome]	[konfořme]	'in agreement'
[alpřoxa]	[alfořxa]	'wallet'

2.1333 - For #CrV we have:

<u>pr</u> [přomeš]	<u>tr</u> [třabena]	<u>kr</u> [křakaďa]
[přinc]	[třamaŋkulu]	[křabelin]
[přoba]	[třiku]	[křištaw]
[přešt]	[třuke]	[křištal]
[přešeški]	[třešna]	[křuciaga]
[přemu]	[třiškanca]	
<u>br</u> [břokolio]	<u>dr</u> [BN, [dřaw-]	<u>gr</u> [gřina]
[břawki]	(not only BN:	
[břaŋka]	old AN, etc.)	
[břuša]		
[břoma]		
<u>fr</u> [fřaka]		
[fřajďe]		
[fřaŋko]		
[fřanćeš]		
[fřoga]		

Again it is hard to find any example with gr. And:

a) most of them are recent loans: Sp. [proměša]. Sp. [prweba]. Sp. [prešto], and so on.

b) Sometimes, the old equivalent of the more recent loans shows an epenthesis; [foroga] (= [fřoga]), [girišti(n)o] (= [křištaw]), [dřaw-] (= [deraw-]), etc..

c) Sometimes the br cluster comes from a more difficult bl:
 [b̄ruša] < Sp. [blúša]; [k̄rabelin], Sp. [klaβél]

Or from an unnecessary metathesis: [t̄rāβena], Sp. Fr. [taβérna, tavérn].

d) We have one example of #frwV:

[f̄rwitu], Fr. [fr̄wí], "fruit", 'fruit'

2.134 When we go into the C clusters, it is almost impossible to find anything but very recent and anomalous loans:

[koβlakari]	[plasa]
[pošib̄le]	[plegu]
[šaf̄la]	[klaše]
	[blaj]
	[flakia]
	[flakuška]

The old loans don't show any stop before l:

Lat. placet Bsq. [laket]; or, by epenthesis: [balakatu]
 (< Sp. aplac.) and even some recent loans show the same tendency:

Sp. [florénθjo], Bsq. [lorencido], or [lorencio] at least.

2.135 So we can write the list:

pr, tr, kr, br, (dr), (gr), fr
 (pl), (bl), (fl); with *tl, *dl.

3 Rhymes

3.1 As we wrote before: falling diphthongs are normal in all the dialects of Basque; and we have five: [aj, ej, oj, aw, ew]. For example:

[hajc], 'rock'
 [séj], 'six'
 [bakojc], 'each'
 [law], 'four'
 [lew̄n], 'smooth'

3.2 Basque has never a voiced sound in final position, nor in syllable final position. Nor has, today, any r\$ or r#.

3.3 Final clusters.

3.31 VCC\$ rimes.

For example:

[arins\$ki]	[bērs\$kin]
[dakārs\$kit]	[ehōrs\$le]
[leb̄ils\$ke]	[jans\$kerá]

[ahans\$ten]	[la <u>ɓ</u> u <u>r</u> s\$ki]
[eho <u>r</u> s\$ket <u>a</u>]	[fun <u>s</u> \$ki]
[gorans\$ko]	[a <u>r</u> s\$to <u>l</u>] (arch.)
[be <u>l</u> s\$ko <u>t</u> e]	[ho <u>r</u> s'-to] (arch.)

Sometimes it is possible to read:

"berantkor" (= [berantkor] (?))
 "ausartki" (usually [awsarki])
 "arruntki") [aruŋki], without /t/)

3.322 And we have too:

[su <u>ɓ</u> ia <u>w</u> <u>r</u>]	(sometimes pronounced [su <u>ɓ</u> ja <u>w</u> <u>r</u>]. in Spanish)
[mendaw <u>r</u>]	[hajc]
[i <u>ŋ</u> čaw <u>r</u>]	[no <u>l</u> a <u>ɓ</u> aj <u>t</u>]
[i <u>ŋ</u> čaw <u>š</u> ti]	[bako <u>j</u> c]
[haw <u>ć</u>]	[oto <u>j</u> c]
[le <u>w</u> n]	[majs]
[a <u>r</u> awn]	[gajc]

Very common, falling diphthongs being very common as well.

3.32 For VCC# we have:

[ahunc]	[bo <u>š</u> t]
[ha <u>r</u> č]	[p <u>r</u> e <u>š</u> t]
[umesu <u>r</u> č]	[ci <u>m</u> i <u>š</u> t]
[ha <u>l</u> c]	[de <u>r</u> i <u>š</u> t]
[me <u>n</u> ć]	[de <u>r</u> i <u>š</u> k]
[anc]	[da <u>k</u> u <u>š</u> t]
[bu <u>l</u> c]	
[aw <u>š</u> a <u>r</u> t]	
[da <u>k</u> a <u>r</u> t]	
[da <u>k</u> a <u>r</u> k]	
[ba <u>r</u> t]	
[a <u>r</u> unt]	

and, for CC after a falling diphthong:

[de <u>w</u> š <u>t</u>]	[e <u>w</u> l <u>c</u>]
[de <u>w</u> š <u>k</u>]	[e <u>r</u> l <u>w</u> nc]
[di <u>r</u> aw <u>š</u> t]	[de <u>w</u> r <u>č</u>] (arch.)

[awnc], [ajnc]
[sawśk]

[ařawlc]
[beawřt] (pop.
"behar dut'
AN)

with a template VCCC# (maximum cluster in word final position).

4. Some immediate consequences

4.1 For the onsets we found C as the old normal one (or CC when we have /r/ as second element; and /l/ in very recent and rare loans). It is clear that the affricates are monophonematic in Basque; and that the orthographe is misleading: "tz", "ts" and "tx" for, respectively, [c], [č] and [č̣].

We find the same conclusion for the rhymes. The template for consonantal CC is normally: [-obs] [+obs]. But it can be [+obs] [+obs] iff the first one is [+cont], and the second one [-cont]. So it is impossible to consider the affricates as bi-phonematic; unless we accept another template, and even another sonority hierarchy. They are monophonematic.

4.2. There is not any symmetry about the glides (j, w). They can normally go after a syllabic segment; but this is not the case before it. (Again, not usually; except in BN, S, R).

4.3 The aspirated stops (written "ph", "th" and "kh", but the syllable boundary being on left: \$ph, \$th, \$kh), can go only immediately before the vowel. It is normal to believe that the old Basque only had \$C as possible onset; the aspirated stops being, of course, monophonematic (the orthograph is again misleading); and are used only in L, BN, S.

5. Sonority hierarchy

Looking at the possible onsets and rhymes, the sonority hierarchy (inverted, of course) shows up this order:

(stops) < (affric) < (fric) < (nasals) < 1 < r < (j,w) < V

5.1 The position of /f/ is ambiguous (the sound seems to be recent, and badly integrated in the phonological system). We have frV (as prV, etc.): and we don't have srV, etc. (R and some varieties of BN excepted).

5.2 /h/ can only be before V in L; but it can precede a rising diphthong in BN and S. In onsets it goes with the fricatives, but not in rhymes; since sequences Vh are impossible. Same situation after a non-syllabic vowel.

5.3 The group [fric] [affric.] is possible in rhymes:

[apajsč̣o], 'little priest'

even if it is not very frequent.

5.4 [w] is more consonantal than [j] (less sonore). It is not possible to see it directly, but there are different reasons to believe it. For example: in the declension, the items with final w, go with the consonantal

items; but it is less frequent for items in j. It is especially clear with [gaw], 'night' (= [gaj], in R and S). The suffix -ko (= 'of') gives:

[gaw] [gaweko] (b, G, L, AN); but [gaj] → [gajko], (S, R).

the same as [gajc] → [gajceko] (never *[gajcko] or *[gajsko]).

5.5 So we could suggest as sonority hierarchy:

$$\begin{Bmatrix} p, t, k \\ b, d, g \end{Bmatrix} < \{c, \acute{c}, \check{c}\} < f < \{s, \acute{s}, \check{s}\} < \{m, n\} < l < r < w < j < V$$

6 Onset tree

6.1 For the old items (old Basque) we can postulate:

We put [+cons] in order to avoid the rising diphthongs.

6.2. If we consider to be necessary to generate rising diphthongs, because of:

- a) the existence of such diphthongs in BN, S, R.
- b) the general existence of rising [wi] in all dialects (but not of [ju]; recall 5.4 in this respect).
- c) the existence of a lot of recent loans with rising diphthongs: [šosjalizmo], for example.
- d) the very extended ethnic forms with rising diphthongs, even in G or B. For example:

G, [dʒat], 'I (do) it'

B, [žwat], ""

And we would need:

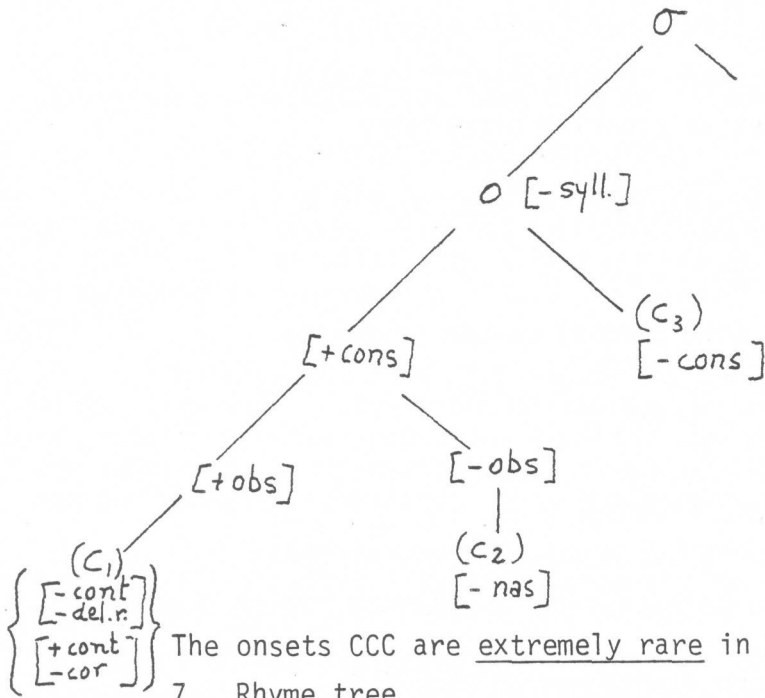

with $\left\{ \begin{matrix} \phi \\ C_1 \\ C_2 \\ C_1, C_2 \end{matrix} \right\}$ (ex. bel.)

C meaning [-syll] and V [+syll]. And the glide being aleatory (not obligatory). (F.i.: [jawrta], village in Navarre).

6.3 If we want to integrate the groups [+obs] [-obs], we could

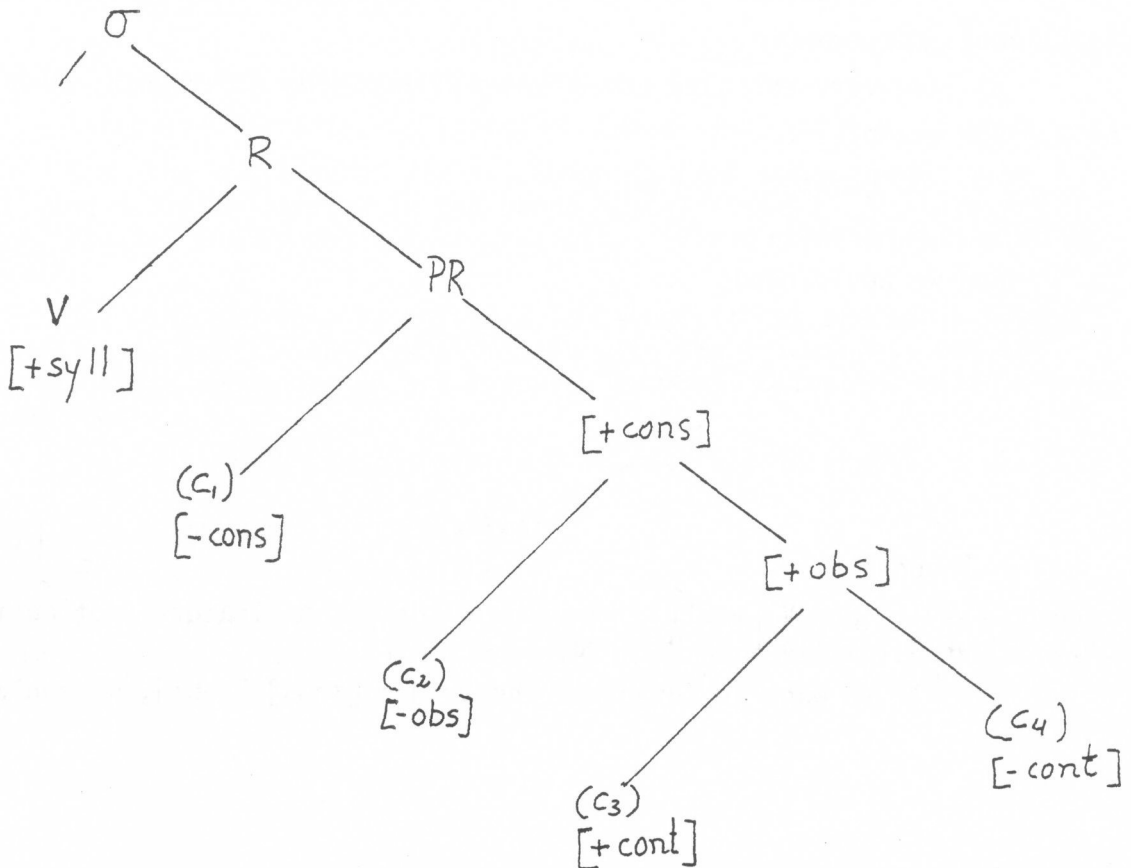

suggest finally for Basque onsets:

7 Rhyme tree

It seems that Basque has not changed in rhymes.

We could postulate:

7.1 We have never *C₂ C₃ C₄ (= * [obs] [+cont] [-cont])

For the three possible C (after V(C₁)), the possible clusters are

- C₂ C₃ [-obs] $\begin{bmatrix} +\text{obs} \\ +\text{cont} \end{bmatrix}$

- C₂ C₄ [-obs] $\begin{bmatrix} +\text{obs} \\ -\text{cont} \end{bmatrix}$

- C₃ C₄ $\begin{bmatrix} +\text{obs} \\ +\text{cont} \end{bmatrix}$ $\begin{bmatrix} +\text{obs} \\ -\text{cont} \end{bmatrix}$

8 Suffixes

Basque has some C suffixes:

-k, ergative; and 2.pers. marker;

-t, 1. pers. mark.;

-n, 2. pers. mark., femin.;

-s, instrumental.

8.1 When we add -k to a noun (proper name), no linking vowel is required if the word ends in V:

[majte] [majtek]

[peru] [peruk]

But when it ends by C, an e is required:

[olac] [olacek]

[ajtoř] [ajtořek]

Normally Vj diphthongs go with V-items, and Vw diphthongs with C-items:

[garaj] [garajk]

[hamalaw] [hamalawek]

It is curious; since the rhyme awk could be possible. We are obliged to see that:

[olac#k] → [olacek]

[hamalaw#k] → [hamalawek]

8.2 But when we add -k to a verb, the direct junction is allowed:

(B) [dweśt] 'he (does) to me'
 [dewśk] '...to you' (masc.)
 [dewćo] '...to him'
 [dewśku] '...to us'
 [dewću] '...to you' (resp.)
 [dewćue] '...to you' (pl.)
